Goldstar Minerals Closes Acquisition of New Brunswick Tungsten Property

- Announces Resignation of Director

Montreal, Québec – February 18, 2014 – Goldstar Minerals Inc. (“Goldstar” or “the Company”) (**TSX Venture Exchange: GDM**) announces that it has closed the acquisition of the Lake George Tungsten property in New Brunswick, following completion of its due diligence and the receipt of all regulatory approvals.

As announced on December 24th 2013, the Company entered into a Mineral Option and Sale Agreement with Charles Morrissy with respect to a 46 claim tungsten property covering an area of 9.5 km² in New Brunswick. The property which is approximately 40 km west of Fredericton and adjacent to the north to the past producing Lake George antimony mine, is close to existing infrastructures and has excellent year-round access.

Upon closing and as provided by the acquisition agreement, Charles Morrissy received a cash payment of \$25,000, as well as 100,000 treasury shares. In addition, Goldstar will pay Mr. Morrissy \$100,000 on each anniversary date of the closing up to the fifth anniversary to complete the acquisition of a 90% interest in the property. Goldstar can increase its interest to 95% by a further payment of \$1,000,000, and 100% by an additional payment of \$2,000,000. The Company has also agreed to pay \$25,000 to Mr. Morrissy every year for a period of five years as an advance on the \$1,000,000 payment referred to in the previous sentence. Concurrent with the closing, the Company also issued 29,230 shares to geologist Luciano Vendittelli, who acted as finder in the transaction. A balance of 70,770 shares will be payable to Vendittelli on February 14, 2015 upon the Company making the first of five annual payments to Charles Morrissy.

Lake George Property

The property lies southeast of the Hackshaw Granite, a phase related to the Pokiok Batholith. A cupola of this granitic body has intruded into Silurian Age Kingslear Group metasedimentary rocks hosting the Lake George Antimony Deposit. Hydrothermal alteration has been observed from historical work and occurs along numerous northerly and easterly trending structures.

Exploration diamond drilling conducted during the late 1970’s and early 1980’s outlined a broad zone of tungsten bearing scheelite and molybdenite type mineralization located within an area located north of the Lake George mine site. The W-Mo mineralization is hosted within calc-silicate rocks and a network of cross-cutting quartz veinlets which appear to be associated with the presence of a buried monzogranite intrusion located approximately 1.0 km north of the Lake George mine site.

Historical diamond drill holes returned the following tungsten (WO₃) assay values:

|

<u>Hole #</u>	<u>Depth (m)</u>	<u>Width (m)</u>	<u>WO₃</u>
DDH#78-7	71.63-76.66	5.03	0.36%
DDH#78-7	78.33-82.60	4.27	0.29%
DDH#81-26	109.73-248.41	138.68	0.15%

Other Corporate Development

The Company announces the resignation of Mr. Simon Marcotte as Director and expects to appoint a new board director in the coming weeks. The Board of Directors is presently comprised of Benoit Moreau, president of Goldstar Minerals; Francois Perron, a Board member of Yorbeau Resources inc. and Apogee Silver Ltd.; Stephen Butrenchuk, a professional geologist and former President and CEO of Gold Ridge Exploration Corp; and Mark Trevisiol, currently President and CEO of Silver Bear Resources.
