**For Immediate Release**

**Goldstar reports additional drill results at its Lac Anctil  
Property in Northern Québec, Canada**

**Montréal, Québec – April 28, 2022** – Goldstar Minerals Inc. (“Goldstar” or the “Corporation”) (TSX-V: GDM) announces that it has received additional assay results for 4 diamond drill holes from its first phase drilling program at its Lac Anctil Property, located near the town of Chapais in Northern Québec, Canada. The program consisted of 13 holes totaling 2,703 metres aimed to test new gold occurrences identified at surface, to confirm the presence of the gold mineralization discovered by limited historical drilling (16 holes – 2,256 metres), to gather structural and geological information on the felsic intrusion outlined by historical drilling and to test a potential prominent structural feature, possibly oriented northeast-southwest.

Best results obtained in these 4 holes were 0.32 g/t Au over 0.9 m in hole AN-21-13.

Results from these 4 holes are detailed down below:

Hole number	Azimuth	Plunge	From (metres)	To (metres)	Interval* (metres)	Gold (Au) (g/t)	Remarks
AN-21-03	40°	-45°				No significant results	
AN-21-07	130°	-45°				No significant results	
AN-21-08	310°	-45°				No significant results	
AN-21-13	230°	-45°	135.9	136.8	0.9	0.32	Spatially related to a tonalite intrusion

*\* Reported drill intersections are not true widths. Currently there is insufficient information with respect to the mineralization to evaluate true orientations. This mineralization is not necessarily representative of the mineralization hosted on the property.*

Gold assays were performed at AGAT Laboratories located in Mississauga, Ontario using fire assay and an AAS finish on 50 g charge samples. Standards and blanks were inserted every 25 samples.

The Corporation will report the assays from the 3 remaining holes (holes AN-21-04, AN-21-11 and AN-21-12 / 630.0 metres) once they are received and compiled. Of note, among these remaining holes, two intersected the felsic intrusion.

**Assay results confirm the felsic intrusion is gold-bearing**

Of the four holes reported, only hole AN-21-13 intersected the felsic intrusion between 145.6 and 184.8 m. Near and within that interval, results showed that 10 gold assays yielded values over 50 ppb Au (0.05 g/t Au and up to 0.32 g/t Au).

Sulfides are usually less than 0.5% and locally up to 2% when hematite and quartz veinlets are present. Mineralization occurs at or near geological contacts between felsic dykes or the intrusion and the host mafic volcanics. Overall, assay results indicate that the gold bearing mineralization to the east and the south is fading and disappearing. Of note, again, the 3 remaining holes that are assay pending were drilled to the west and may indicate that the mineralization is stronger in that direction.

The size of the intrusion and related associated felsic dykes, its direction and shape are unknown at the moment.

### **Next steps**

The Corporation awaits the remaining assays, and they will be reported as soon as possible once received and compiled.

### **Disclosure**

The technical information contained in this news release has been reviewed and approved by Benoit Moreau, P.Eng., a consultant of the Corporation. Mr. Moreau is a qualified person as defined by National Instrument 43-101, Standards of Disclosure for Mineral Projects.

### **Chief Financial Officer**

The Corporation announces that its Chief Financial Officer, Ercan Ugur, has retired and has been replaced by Mr. Jonathan Federico as Interim Chief Financial Officer. The Corporation wishes to express its appreciation for the services provided by Mr. Ugur during his tenure as an officer of Goldstar and wishes him all the best on the occasion of his retirement.
